EXPERIENCE

Divami Design Labs

June 2026 – Present

Software Developer Intern

Hyderabad, India

- Reduced patient-intake chatbot latency by splitting the resume/conversation flow into separate APIs for loading prior responses and generating the next AI question, allowing existing conversation state to render without blocking on LLM generation
- Optimized the voice-processing pipeline by moving multi-speaker detection to raw Sarvam transcripts before translation, eliminating redundant downstream processing and saving up to 6 seconds in the conversation flow
- Engineered a reusable React error-handling layer covering API, validation, microphone, recording, and audio failures, centralizing failure states and consistent user-facing feedback across the intake workflow
- Integrated multilingual voice interactions by adding Sarvam TTS for AI-generated questions, language-aware read-aloud controls, media uploads, and transcript editing within the patient-intake interface

PROJECTS

AI Interview Coach | *FastAPI, PostgreSQL, React, Gemini* | [GitHub](#) | [Demo](#)

May 2026 – Present

- Engineered a FastAPI REST backend with 15 endpoints that uses Gemini to extract technical resume data across 4 sections and generate project-grounded interview questions dynamically during interview sessions
- Built a conversational interview pipeline that evaluates each candidate response across 3 dimensions: specificity, structure, and technical depth and generates subsequent questions while preventing question repetition within a session
- Designed a 5-table PostgreSQL data model linking users, interview sessions, questions, attempts, and scores, persisting per-response evidence and feedback for revisit-able interview history and evaluation
- Implemented JWT authentication, bcrypt password hashing, and per-user ownership checks across protected resources to isolate interview and evaluation data

Job Processing System | *FastAPI, PostgreSQL, SQLAlchemy, React* | [GitHub](#)

June 2026 – Present

- Engineered an asynchronous file-processing pipeline with FastAPI, Redis, and a 3-worker pool, decoupling job submission from execution to process multiple jobs concurrently
- Designed a PostgreSQL-backed job lifecycle across 4 states: QUEUED, PROCESSING, COMPLETED, and FAILED, persisting results, timestamps, and error metadata as the source of truth
- Implemented a 5-endpoint REST API for job creation, history, status/result retrieval, deletion, and health monitoring, using Redis as a queue for job IDs while keeping file metadata and state in PostgreSQL
- Built a React dashboard for file uploads and job monitoring, exposing current status, results, timestamps, and failure information while supporting bounded retries and worker recovery

SKILLS

Languages : C, Java, Python, JavaScript, SQL

Frontend : HTML, CSS, React.js

Backend & Databases : Node.js, FastAPI, MySQL, PostgreSQL

Tools : Git, GitHub, VS Code

EDUCATION

National Institute of Technology, Srinagar

Aug. 2024 – May 2028

Bachelor of Technology in Information Technology

Jammu & Kashmir

* **CGPA**: 8.07 / 10
